

Lesson 4: Recursion

Jiun-Long Huang
Department of Computer Science
National Chiao Tung University

Local Variables

◆ Local variables

- Automatic storage duration
- Block scope

◆ Global variables

- Static storage duration
- File scope

◆ C Tutor

- <http://www.pythontutor.com/c.html#mode=edit>

```
double a, b;
double average(double a, double b)
{
    return (a+b)/2;}
int main(void)
{
    double a, b, c;
    a=1.0;
    b=2.0;
    c=average(a,b);
    return 0;
}
```

C (gcc 4.8, C11)

EXPERIMENTAL! [known bugs/limitations](#)

```
1 double a, b;
2 double average(double a, double b)
3 {
4     return (a+b)/2;
5 }
6 int main(void)
7 {
8     double a, b, c;
9     a=1.0;
10    b=2.0;
11    c=average(a,b);
12    return 0;
13 }
```

	Stack	Heap
Global variables		
a	double 0	
b	double 0	
main		
a	double 1	
b	double 2	
c	double 1.5	

```
#include <stdio.h>
int x=1,y=2; // global variables
int sum(int x, int y) // parameters
{
    int sum; // local variables
    sum=x+y;
    x++;
    return sum;
}
int main()
{
    // call by value
    printf("%d\n",sum(x,y));
    int x=10, y=20; // local variables
    printf("%d\n",sum(x,y));
    return 0;
}
```

Static Variables

- ◆ Static (local) variables
 - Static storage duration
 - Block scope

```
#include <stdio.h>
int x=1,y=2; // global variables
int sum(int x, int y) // parameters
{
    static int sum; // static variables
    sum=x+y;
    x++;
    return sum;
}
int main()
{
    // call by value
    printf("%d\n",sum(x,y));
    int x=10, y=20; // local variables
    printf("%d\n",sum(x,y));
    return 0;
}
```

C (gcc 4.8, C11)

EXPERIMENTAL! [known limitations](#)

```
1 #include <stdio.h>
2 int x=1,y=2; // global variables
3 int sum(int x, int y) // parameters
4 {
5     static int sum; // static variables
6     sum=x+y;
7     x++;
8     return sum;
9 }
10 int main()
11 {
12     // call by value
13     printf("%d\n",sum(x,y));
14     int x=10, y=20; // local variables
15     printf("%d\n",sum(x,y));
16     return 0;
17 }
```

Tower of Hanoi (Hanoi Tower, 河内塔)

https://en.wikipedia.org/wiki/Tower_of_Hanoi

Pseudo-code

◆ How to move four disks from peg A to peg C?

Number of disks, Source peg, Destination peg, Buffer peg

Move(3, A, C, B)

{

Move(2, A, B, C)

Move one disk from peg A to peg C

Move(2, B, C, A)

}

Move(3, A, C, B)

Peg A

Peg B

Peg C

Step 1: Move(2,A,B,C)

Peg A

Peg B

Peg C

Step 2: move one disk from peg A to peg C

Step 3: Move(2, B, C, A)

```
#include <stdio.h>
void Move(int no, char src, char dest, char buf)
{
    if (no<=1)
    {
        printf("Move 1 disk from peg %c to peg %c\n", src, dest);
    }
    else
    {
        Move(no-1,src,buf,dest);
        printf("Move 1 disk from peg %c to peg %c\n", src, dest);
        Move(no-1,buf,dest,src);
    }
}
int main()
{
    Move(3, 'A', 'C', 'B');
    return 0;
}
```

Result

- ◆ Move 1 disk from peg A to peg C
- ◆ Move 1 disk from peg A to peg B
- ◆ Move 1 disk from peg C to peg B
- ◆ Move 1 disk from peg A to peg C
- ◆ Move 1 disk from peg B to peg A
- ◆ Move 1 disk from peg B to peg C
- ◆ Move 1 disk from peg A to peg C

Move(3, A, C, B)

Peg B

Peg C

Move 6

Peg A

Peg B

Peg C

Move 7

Peg A

Peg B

Peg C

Practice

◆ Sum $(1+2+3...+n)$

- $\text{sum}(n) = \text{sum}(n-1) + n$, when $n > 1$
- $\text{sum}(1) = 1$

◆ Fibonacci sequence (費氏數列)

- $\text{fib}(n) = \text{fib}(n-1) + \text{fib}(n-2)$ when $n > 2$
- $\text{fib}(1) = 1$
- $\text{fib}(2) = 1$
